

CASE STUDY - REVOPS & GROWTH INTERN

Overview

This case has two stages:

1. **Take-home** - a short plan and a working build, submitted 24 hours before the live session
2. **Live session (60 minutes)** - screen-shared (at Breega's office or online)

The goal is to assess how you structure a problem, how you build something that actually works, and how you operate hands-on with modern tooling.

The take-home brief is described below. The live session will be a working session: you should bring your machine, your build, and the AI tools you typically use (Claude, ChatGPT, Cursor, Cloud Code, etc.).

Duration: We believe that the maximum time to spend on this case is 2 hours.

Context

You are joining Breega's Scaling Squad. One of our portfolio companies, **Northstar**, reaches out for help.

Northstar is a B2B SaaS company that builds a **data governance product** for **data teams** in **European scale-ups (50-500 employees)**. They currently generate 8-10 qualified demos per month, all coming from their founders' network.

The founders have just hired 2 AEs and 1 SDR to accelerate growth, and want to double pipeline volume over the next three months. The team has very limited experience with cold outreach: the SDR ran a few Lemlist campaigns on Apollo lists in 2025, with positive reply rates below 1%.

Their monthly tooling budget for this initiative is capped at 600€.

Your mission

Help Northstar lay the foundations of a cold outreach machine. The exercise is split into two steps: first, a short strategic plan; second, a working build that brings that plan to life on a concrete first brick.

Step 1 - Strategic plan

Before touching any tool, take a step back and write a short plan (one page is enough) that frames how you would help Northstar approach this initiative. The format and structure are up to you - we want to understand how you think about the problem and the choices you make to address it.

Step 2 - Functional build

Build the machine that Northstar will use to launch their cold outreach campaigns. Concretely, this means everything that sits upstream of the sending tool: turning a target audience into a list of qualified, enriched, prioritised leads with the necessary context to power personalised messaging.

This is not a slide deck exercise and not a mockup. We expect a real, working system that runs end-to-end on a small dataset and produces an output that could be plugged directly into a sending tool. The scope can be minimal, but it must actually work.

You are free to choose your stack. Briefly justify your choices in your written plan.

What to submit

- The written plan (Step 1)
- The functional build (Step 2) - we should be able to access it directly, or you will walk us through it during the live session
- A 3-minute [Loom](#) video showing your build running end-to-end on a small dataset

A note on cost

You are not expected to spend any money on this case. Most of the relevant tools offer free trials or free tiers, and that is more than enough to deliver what we are asking for. If a paid tool seems to be the only viable option in your view, find an alternative or explain the trade-off in your written plan.

Evaluation criteria

- Quality of business reasoning before diving into execution
- Tooling choices and trade-offs
- Ability to ship something that actually works
- Level of specificity in your approach

Thank you in advance for working on this Case Study!
